Let $B_k = B_0(2, 7, k)$ be the largest two-generator finite group of exponent 7 and nilpotency class $k$. Hall’s polynomials of $B_k$ for $k \leq 4$ are calculated.

Keywords: periodic group, collection process, Hall’s polynomials.

Let $B_k = B_0(2, 7, k)$ be the largest two-generator finite group of exponent 7 and nilpotency class $k$. In this class, the largest group is the group $B_{28}$, which has the order $7^{20416}$ [1]. For each $B_k$ a power commutator presentation is obtained [1]. Let $a_1^{x_1} \cdots a_n^{x_n}$ and $a_1^{y_1} \cdots a_n^{y_n}$ be two arbitrary elements in the group $B_k$ recorded in the commutator form. Then their product is equal

$$a_1^{x_1} \cdots a_n^{x_n} \cdot a_1^{y_1} \cdots a_n^{y_n} = a_1^{z_1} \cdots a_n^{z_n}.$$ 

Powers $z_i$ are to be found based on the collection process (see [2, 3]) which is implemented in the computer algebra systems GAP and MAGMA. Furthermore, there is an alternative method for calculating products of elements of the group, proposed by Hall (see [4]). Hall showed that $z_i$ are polynomial functions (over the field $\mathbb{Z}_7$ in this case), depending on the variables $x_1, \ldots, x_i, y_1, \ldots, y_i$, which is now called Hall’s polynomials. According to [4]

$$z_i = x_i + y_i + p_i(x_1, \ldots, x_{i-1}, y_1, \ldots, y_{i-1}).$$

Hall’s polynomials are necessary in solving problems that require multiple products of the elements of the group. Study of the structure of the Cayley graph of some group is one of these problems [5, 6]. The computational experiments carried out on the computer in two-generator groups of exponent five (see [7]) showed that the method of Hall’s polynomials has an advantage over the traditional collection process. Therefore, there is a reason to believe that the use of polynomials would be preferable than the collection process in the study of Cayley graphs of $B_k$ groups. It should also be noted that this method is easily software-implemented including multiprocessor computer systems.

Previously unknown Hall’s polynomials of $B_k$ are calculated within the framework of this paper. For $k > 4$ polynomials are calculated similarly but their output takes considerably more space so it makes impossible to verify the proof without use of computers.

The main result of this paper is

Theorem. Let $a_1^{x_1} \cdots a_n^{x_n}$ and $a_1^{y_1} \cdots a_n^{y_n}$ be two arbitrary elements of the group $B_k$ recorded in the commutator form where $k \in \mathbb{N}$ or $k \leq 4$. Then their product is equal $a_1^{x_1} \cdots a_n^{x_n} \cdot a_1^{y_1} \cdots a_n^{y_n} =$
\(a^n_1 \ldots a^n_k,\) where \(z_i \in \mathbb{Z}_n,\) are Hall’s polynomials given by formulas (1–2) for \(k = 1,\) (1–3) for \(k = 2,\) (1–5) for \(k = 3\) and (1–8) for \(k = 4.\)

\[
z_1 = x_1 + y_1, \quad (1)
\]
\[
z_2 = x_2 + y_2, \quad (2)
\]
\[
z_3 = x_3 + y_3 + x_2y_1, \quad (3)
\]
\[
z_4 = x_4 + y_4 + 3x_2y_1 + x_3y_1 + 4x_2y_1^2, \quad (4)
\]
\[
z_5 = x_5 + y_5 + 3x_2y_1 + x_3y_2 + 4x_2y_1^2 + x_2y_1y_2, \quad (5)
\]
\[
z_6 = x_6 + y_6 + 5x_2y_1 + 3x_3y_1 + x_4y_1 + 3x_2y_1^2 + 6x_2y_1^3 + 4x_3y_1^2, \quad (6)
\]
\[
z_7 = x_7 + y_7 + 2x_2y_1 + 2x_2y_1 + x_4y_2 + x_5y_1 + 5x_2y_1^2 + 5x_2y_1 + 4x_2y_1^3 + 6x_2y_1^4 + x_2y_1y_2 + x_3y_1y_2, \quad (7)
\]
\[
z_8 = x_8 + y_8 + 5x_2y_1 + 3x_3y_2 + x_5y_2 + 3x_2y_1 + 6x_2y_1^3 + 4x_3y_2 + 4x_2y_1^2 + 4x_2y_1y_2 + 6x_2y_1y_2. \quad (8)
\]

1. Proof of the Theorem

Let’s calculate the Hall’s polynomials for the group \(B_4.\) Dealing with this group we also obtain polynomials for groups \(B_1, B_2\) and \(B_3\) so no need to study separately these cases. When \(k < 4\) commutators which has a weight is more than \(k\) are not considered because of they are definitionally equal to the group identity.

Using GAP we obtain a power commutator presentation of \(B_4.\)

Commutators of weight 1:

\[a_1, a_2 — \text{generators of the group.}\]

Commutators of weight 2:

\[a_3 = [a_2, a_1].\]

Commutators of weight 3:

\[a_4 = [a_3, a_1] = [a_2, a_1, a_1], \quad a_5 = [a_3, a_2] = [a_2, a_1, a_2].\]

Commutators of weight 4:

\[a_6 = [a_4, a_1] = [a_2, a_1, a_1, a_1], \quad a_7 = [a_5, a_1] = [a_2, a_1, a_2, a_1], \quad a_8 = [a_5, a_2] = [a_2, a_1, a_2, a_2].\]

List of defining relations \(R\) for commutators:

\[a^7_i = 1 \quad (1 \leq i \leq 8), \quad [a_2, a_1] = a_3, \quad [a_3, a_1] = a_4, \quad [a_3, a_2] = a_5, \quad [a_4, a_1] = a_6,\]
\[a_4, a_2] = a_7, \quad [a_4, a_3] = 1, \quad [a_5, a_1] = a_7, \quad [a_5, a_2] = a_8, \quad [a_5, a_3] = 1, \quad [a_5, a_4] = 1,\]
\[a_6, a_1] = 1, \quad [a_6, a_2] = 1, \quad [a_6, a_3] = 1, \quad [a_6, a_4] = 1, \quad [a_6, a_5] = 1, \quad [a_7, a_1] = 1,\]
\[a_7, a_2] = 1, \quad [a_7, a_3] = 1, \quad [a_7, a_4] = 1, \quad [a_7, a_5] = 1, \quad [a_7, a_6] = 1, \quad [a_8, a_1] = 1,\]
\[a_8, a_2] = 1, \quad [a_8, a_3] = 1, \quad [a_8, a_4] = 1, \quad [a_8, a_5] = 1, \quad [a_8, a_6] = 1, \quad [a_8, a_7] = 1.\]
Thus,

\[ B_4 = \langle a_1, a_2, a_3, a_4, a_5, a_6, a_7, a_8 \mid R \rangle. \]

Each element of the group is expressed uniquely as a normal commutator word:

\[ \forall g \in B_4 \quad g = a_1^{x_1} a_2^{x_2} a_3^{x_3} a_4^{x_4} a_5^{x_5} a_6^{x_6} a_7^{x_7} a_8^{x_8}, \quad x_i \in \mathbb{Z}_7. \]

Sometimes we will write \( g = (x_1, \ldots, x_8). \)

In order to determine the functions \( z_i \) first we need to calculate the products of \( a_i^y a_i^x \) for all \( 1 \leq i \leq 8, \; x, y = 1, 2, 3, 4, 5, 6. \) For the pair \((j, i)\) it is required to find the interpolation polynomial for each of the 8 commutators by the 36 values of the product \((y, x)\).

Let’s start with the first pair \( a_2^y a_1^x: \)

\[
\begin{align*}
    a_2^y a_1^1 &= (1, 1, 0, 0, 0, 0, 0, 0), \quad a_2^y a_1^2 = (2, 1, 2, 1, 0, 0, 0, 0), \quad a_2^y a_1^3 = (3, 1, 3, 0, 1, 0, 0), \\
    a_2^y a_1^4 &= (4, 1, 4, 0, 0, 4, 0, 0), \quad a_2^y a_1^5 = (5, 1, 5, 0, 3, 0, 0), \quad a_2^y a_1^6 = (6, 1, 6, 1, 0, 0, 0), \\
    a_2^y a_1^7 &= (1, 2, 2, 0, 1, 0, 0, 0), \quad a_2^y a_1^8 = (2, 2, 4, 2, 0, 1, 0, 0), \quad a_2^y a_1^9 = (3, 2, 6, 3, 2, 3, 0), \\
    a_2^y a_1^{10} &= (4, 2, 1, 5, 4, 1, 6, 0), \quad a_2^y a_1^{11} = (5, 2, 3, 6, 5, 6, 3, 0), \quad a_2^y a_1^{12} = (6, 2, 5, 6, 5, 1, 0), \\
    a_2^y a_1^{13} &= (1, 3, 3, 0, 3, 0, 0, 1), \quad a_2^y a_1^{14} = (2, 3, 6, 3, 6, 0, 3, 2), \quad a_2^y a_1^{15} = (3, 3, 2, 2, 2, 3, 2, 3), \\
    a_2^y a_1^{16} &= (4, 3, 5, 4, 5, 4, 4), \quad a_2^y a_1^{17} = (5, 3, 1, 2, 1, 2, 2, 5), \quad a_2^y a_1^{18} = (6, 3, 4, 3, 4, 4, 3, 6), \\
    a_2^y a_1^{19} &= (1, 4, 4, 0, 6, 0, 0, 4), \quad a_2^y a_1^{20} = (2, 4, 1, 4, 5, 0, 6, 1), \quad a_2^y a_1^{21} = (3, 4, 5, 5, 4, 4, 4, 5), \\
    a_2^y a_1^{22} &= (4, 4, 2, 3, 2, 1, 2), \quad a_2^y a_1^{23} = (5, 4, 6, 2, 5, 4, 6), \quad a_2^y a_1^{24} = (6, 4, 3, 4, 1, 3, 6, 3), \\
    a_2^y a_1^{25} &= (1, 5, 5, 0, 3, 0, 0, 3), \quad a_2^y a_1^{26} = (2, 5, 3, 5, 6, 0, 3, 6), \quad a_2^y a_1^{27} = (3, 5, 1, 1, 2, 5, 2, 2), \\
    a_2^y a_1^{28} &= (4, 5, 6, 2, 5, 6, 4, 5), \quad a_2^y a_1^{29} = (5, 5, 4, 1, 1, 2, 1), \quad a_2^y a_1^{30} = (6, 5, 2, 5, 4, 2, 3, 4), \\
    a_2^y a_1^{31} &= (1, 6, 6, 0, 1, 0, 0, 6), \quad a_2^y a_1^{32} = (2, 6, 5, 6, 2, 0, 1, 5), \quad a_2^y a_1^{33} = (3, 6, 4, 4, 3, 6, 3, 4), \\
    a_2^y a_1^{34} &= (4, 6, 3, 1, 4, 3, 6, 3), \quad a_2^y a_1^{35} = (5, 6, 2, 4, 5, 4, 3, 2), \quad a_2^y a_1^{36} = (6, 6, 1, 6, 1, 6, 1, 1).
\]

Let’s write:

\[
a_2^y a_1^x = a_1^x a_2^y a_3^{f^{(1,2)}(x,y)} a_4^{f^{(1,2)}(x,y)} \cdots a_8^{f^{(1,2)}(x,y)},
\]

where \( f^{(1,2)}(x,y) = \sum_{p=1}^{6} \sum_{q=1}^{6} \beta_{pq} x^p y^q \) are some polynomials over the field \( \mathbb{Z}_7. \) To find them let’s perform interpolation for each commutator \( r = 3, 4, \ldots, 8. \)

To find \( f^{(1,2)}(x,y) \) it is required to solve a system of linear equations over the given field:

\[
\sum_{p=1}^{6} \sum_{q=1}^{6} \beta_{pq} x^p y^q = z_p^{yx} \quad \forall \; x, y = 1, 2, 3, 4, 5, 6,
\]

where \( z_p^{yx} \) is a value of \( r \)-th commutator for the pair \( (y, x). \) This system will have 36 variables and consist of 36 equations.
Let’s show how to find $f_{3}^{(1,2)}(x, y)$ at the example of the 8-th commutator. For short, let’s write $\beta_{pq}$ instead of $\beta_{pq}^{a}$. Substituting in (9) all values of $z_{8}^{p}$ we receive:

$$
\begin{array}{cccc}
1 & 1 & 1 & 1 \\
2 & 2 & 2 & 2 \\
3 & 3 & 3 & 3 \\
4 & 4 & 4 & 4 \\
5 & 5 & 5 & 5 \\
6 & 6 & 6 & 6 \\
7 & 7 & 7 & 7 \\
8 & 8 & 8 & 8 \\
\end{array}
$$

The rank of the system matrix is equal to 36, therefore it has the only solution: $\beta_{11} = 5$, $\beta_{12} = 3$, $\beta_{13} = 6$, all the remaining coefficients are equal to zero. Therefore,

$$f_{3}^{(1,2)}(x, y) = 5xy + 3xy^2 + 6xy^3.$$

Similar calculations are applied for all polynomials $f_{i}^{(1,2)}(x, y)$. Here they are:

$$
\begin{align*}
&f_{1}^{(1,2)}(x, y) = x, \\
&f_{2}^{(1,2)}(x, y) = y, \\
&f_{3}^{(1,2)}(x, y) = xy, \\
&f_{4}^{(1,2)}(x, y) = 3xy + 4x^2y, \\
&f_{5}^{(1,2)}(x, y) = 3xy + 4xy^2, \\
&f_{6}^{(1,2)}(x, y) = 5xy + 3x^2y + 6x^3y, \\
&f_{7}^{(1,2)}(x, y) = 2xy + 5xy^2 + 5x^2y + 2x^2y^2, \\
&f_{8}^{(1,2)}(x, y) = 5xy + 3xy^2 + 6xy^3.
\end{align*}

Thus,

$$a_{i}^{x}a_{i}^{x} = (x, y, x, 3xy + 4x^2y, 3xy + 4xy^2, 5xy + 3x^2y + 6x^3y, \\
2xy + 5xy^2 + 5x^2y + 2x^2y^2, 5xy + 3xy^2 + 6xy^3).$$

Using this method let’s calculate other noncommutative $a_{j}^{y}a_{i}^{x}$.

$$a_{i}^{y}a_{i}^{x} = (x, 0, y, xy, 0, 3xy + 4x^2y, 0, 0),$$

$\text{– 189 –}$
Alexander A. Kuznetsov, Konstantin V. Safonov  
Hall’s Polynomials of Finite Two-Generator Groups...

\[
a_y^0 a_x^2 = (0, x, y, 0, 0, 3xy + 4x^2y), \\
a_y^0 a_x^0 = (x, 0, 0, y, 0, xy, 0), \\
a_y^0 a_x^2 = (0, x, 0, y, 0, 0, xy, 0), \\
a_y^0 a_x^1 = (x, 0, 0, 0, y, 0, 0, xy), \\
a_y^0 a_x^2 = (0, x, 0, 0, y, 0, 0, xy). \\
\]

Not listed pairs are commutative, i.e. \(a_y^0 a_x^1 = a_x^1 a_y^0\).

Thus, we have a complete set of relations for the implementation of the collection process in analytical form:

\[
a_j^0 a_i^1 = a_i^1 a_j^0 a_{j+1}^{(i+1)(x,y)} a_{j+2}^{(i+2)(x,y)} \ldots a_k^{(i+k)(x,y)} , \quad 1 \leq i < j \leq 8. \tag{10}
\]

Using (10) we can calculate the product \(a_1^1 \ldots a_8^8, a_1^2 \ldots a_8^8 = a_1^1 \ldots a_8^8\). Following this procedure we will find all \(z_i (1–8)\).

The theorem is proved.

The investigation was supported by the Ministry of Education and Science of the Russian Federation (Project Б 112/14).
