In this work an integral formula for a matrix polydisk is obtained. For a function from the Hardy class it allows to recover its value at any interior point from its values on a part of the Shilov boundary.

Keywords: Carleman’s formula, matrix polydisc.

DOI: 10.17516/1997-1397-2015-8-3-371-374

1. Statement of the problem and preliminaries

Consider a class of holomorphic functions in a domain \( D \) that behave reasonably well near the boundary \( \partial D \). Carleman’s formulas solve the problem of recovery of a function from such a class from its values on a set of uniqueness \( M \subset \partial D \) for this class, which does not contain the Shilov boundary of \( D \).

One-dimensional and multidimensional formulas were studied in the monograph [1]. In the paper [2] a new method is proposed for finding Carleman’s formulas in homogeneous domains using a domain’s automorphisms. In the present paper we use this method for a matrix polydisk.

Let \( Z = (Z_1, Z_2, ..., Z_n) \in \mathbb{C}^n[m \times m] \) be a vector of quadratic matrices of order \( m \) over the field of complex numbers \( \mathbb{C} \). The unit matrix disk is defined as the set

\[
\tau = \{ Z \in \mathbb{C}[m \times m] : ZZ^* < I \},
\]

where \( Z^* = \overline{Z}^t \) is the conjugate transpose of the matrix \( Z \), the notation \( ZZ^* < I \) (\( I \) is the unit \([m \times m]\)-matrix) means that the Hermitian matrix \( I - ZZ^* \) is positive definite. The skeleton of a matrix disk is the set

\[
S(\tau) = \{ Z \in \mathbb{C}[m \times m] : ZZ^* = I \}.
\]

The direct product of matrix disks

\[
T = T_n = \tau^n = \{ Z = (Z_1, ..., Z_n) : Z_j \in \tau, j = 1, ..., n \}
\]

is called the matrix unit polydisk \( T = T_n \) in the space \( \mathbb{C}^n[m \times m] \).

The set \( S(T) = S(\tau) \times \cdots \times S(\tau) \) is called the skeleton of \( T \) (see [3]).

To formulate the main result, we need the following Carleman formula for the unit matrix disk obtained in [2]. Let the set \( M \subset S(\tau) \) have positive measure \( \mu_1 M > 0 \). Denote

\[
M_{0,u} = \{ \xi : \xi \in M, |\lambda| = 1 \}, u \in SU(m),
\]

\[
M'_0 = \{ u : u \in SU(m), m_1 M_{0,u} > 0 \}.
\]

where $SU(m)$ is the group of special unitary matrices, i.e. $\det(u) = 1$, $m_1$ is the normed Lebesgue measure on the unit circle $\partial U$. Further on, let

$$
\varphi_0 = \exp \psi_0, \quad \text{where} \quad \psi_0(\xi) = \frac{1}{2\pi i} \int_{S_{m_n}} \frac{\eta + \lambda}{\eta - \lambda} \frac{d\eta}{\eta}.
$$

The Hardy class $H^1(D)$ is defined as follows: a holomorphic in $D$ function $f(z)$ belongs to the class $H^1(D)$ if

$$
\sup_{0 < r < 1} \int_{S(r)} |f(r\xi)| d\mu_1 < \infty,
$$

where $\mu_1$ is the Lebesgue measure on the skeleton $S(D)$.

**Lemma 1 (2).** Let $f \in H^1(\tau)$. Then the formula

$$
f(0) = \lim_{l \to \infty} \frac{m}{\int_{M_0} d\mu_1} \int_{M} f(\xi) \left[ \frac{\varphi_0(\xi)}{\varphi_0(0)} \right]^l d\mu_1
$$

holds.

## 2. The main part

Let $\Phi_A(Z)$ be an automorphism of a unit matrix polydisc $T_n$ rearranging the points $A \in T_n$ and 0. Such an automorphism has the form (see [4, p. 84])

$$
\Phi_A(Z) = (\Phi_A^1(z^1), \ldots, \Phi_A^n(z^n)),
$$

where

$$
\Phi_A^j(Z^j) = Q^j(Z^j - A^j)(I - (A^j)^*Z^j)^{-1}(R^j)^{-1},
$$

$Q^j$ and $R^j$ are $[m \times m]$-matrices satisfying the following conditions

$$
Q^j \left( I - \overline{A} A^j \right) Q^j = I, \quad \overline{R}^j \left( I - A^j A^j \right) R^j = I,
$$

$$
Q^j A^j + A^j R^j = 0.
$$

In particular, for $A = 0$

$$
\Phi_0(Z) = (\Phi_0^1(z^1), \ldots, \Phi_0^n(z^n))
$$

and

$$
\Phi_0^j(Z^j) = Q^j Z^j (R^j)^{-1}.
$$

Let $E = (E^1, \ldots, E^n) \subset S(T)$ and $\mu E > 0; \, \lambda^j = (\xi^1, \ldots, \xi^n) \in S(T_{n-1})$.

Define the sets

$$
E_{0,\xi} = \left\{ Z : Z \in E, \Phi_0^j(Z^j) = \lambda, \lambda \Phi_0^j(Z^j) = \lambda \Phi_0^j(Z^j), j = 1, \ldots, n, \lambda \in S(\tau) \right\},
$$

$$
\tilde{E}_{0} = \{ Z \in E : \mu_1 E_{0,\xi} > 0 \}.
$$

**Lemma 2.** Let $f \in H^1(T_n)$. Then the following formula

$$
f(0) = \lim_{l \to \infty} \frac{m}{\int_{E_0} d\mu_{m(n-1)}} \int_{E} f(Z) \left[ \frac{\varphi_0(\xi)}{\varphi_0(0)} \right]^l d\mu
$$

holds. Here $\varphi_0 = \exp \psi_0$ and

$$
\psi_0(\xi) = \frac{1}{2\pi i} \int_{E_{0,\xi}} \frac{\eta + \lambda d\eta}{\eta - \lambda} \frac{d\eta}{\eta},
$$

where $E_{0,\xi}$ is defined the same as in (1).
Proof. Let \( \xi = (\xi^2, ..., \xi^n) \in S(T_{n-1}) \). Then by Lemma 1 we have
\[
 f(0) = \frac{m}{\int_{E_{0,\xi}}} \lim_{\mu \rightarrow \infty} \int_{E_{0,\xi}} f(\xi) |\varphi_0(\xi)/\varphi_0(0)|^l \, d\mu_1.
\]
Integrating both parts of this equation over \( E_0 \), we obtain formula (3) since
\[
 \left| \int_{E_{0,\xi}} f(\xi) \left[ \frac{\varphi_0(\xi)}{\varphi_0(0)} \right]^l \, d\mu_1 \right| \leq \left| \int_{S(\tau)} f(\xi) \left[ \frac{\varphi_0(\xi)}{\varphi_0(0)} \right]^l \, d\mu_1 \right| + \left| \frac{\varphi_0(\xi)}{\varphi_0(0)} \right|^l \mu_1 \leq |f(0)| + \left| \int_{S(\tau)} |f(\xi)| \, d\mu_1 \right|.
\]

Here we use the facts that \( \varphi_0(Z) \) is the “quenching” function, and the Cauchy-Szegő formula is applicable for the function \( f \) in \( \tau \) (see [4, p.93]). Therefore the transition to the limit under the integral sign is possible by the Lebesgue theorem.

Formula (3) recovers the value of the function \( f \) at the point 0 from its values on \( E \). Now, with the help of this formula, we shall prove a formula recovering the value of \( f \) at an arbitrary point of the domain \( T_n \).

Denote
\[
 \xi = (\xi^2, ..., \xi^n) \in S(T_{n-1}),
\]
\[
 E_{A,\xi} = \left\{ Z : Z \in E, \Phi_A(Z) = \lambda, \Phi_A(\xi) = \lambda \Phi_A(\xi^j), j = \Xi, n, \lambda \in S(\tau) \right\}.
\]

This set is measurable with respect to the measure \( \mu_1 \) for almost all \( A \) and \( \xi \). Denote by \( \tilde{E}_A \) the set \( \{ \xi : \xi \in S(T_{n-1}), \mu_1 E_{A,\xi} > 0 \} \). The Fubini theorem implies that the \((m-n)\)-dimensional Lebesgue measure of this set is positive. Denote
\[
 \varphi_A = \exp \psi_A, \quad \psi_A(\xi) = \frac{m}{2\pi i} \int_{E_{A,1,w^1}} \frac{\eta + \lambda}{\eta - \lambda} \, d\eta,
\]
where \( E_{A,1,w^1} = \{ \xi^1 \in E_1, \xi = (\Phi_A)^{-1} \left( (\lambda(\Phi_A)^{-1}(w) \right), |\lambda| = 1 \} \), \( W \in \Phi_A(SU(m)) \).

**Theorem 1.** Let \( f \in H^1(T_n), E \subset S(T_n), \mu(E) > 0 \). Then for an arbitrary point \( A \in T_n \) we have the following formula
\[
 f(A) = \frac{m}{\mu E_{m-n}^1(\Phi_A^{-1}(E_A))} \lim_{\mu \rightarrow \infty} \int_E f(Z) \left[ \frac{\varphi_A(Z)}{\varphi_A(A)} \right]^l \prod_{j=1}^n H \left( A^j, Z^j \right) \, d\mu(Z). \tag{4}
\]

Here
\[
 H(A^j, Z^j) = \frac{1}{\det(T(m) - A^j Z^j)}
\]
is the Cauchy-Szegő kernel for the (matrix) generalized disk.

**Proof.** For \( A = 0 \) the statement of Theorem 1 was proved in Lemma 2. Let \( f_A(\xi) = f(\Phi_A^{-1}(\xi)) \). Then \( f_A(0) = f(A) \). It is known that \( f_A \in H^1(T_n) \) (see [2]). By applying Lemma 2 to \( f_A \) and then performing the reverse transformation, we obtain
\[
 f(A) = \frac{m}{\int_{E_A} \mu E_{m-n}^1(\Phi_A^{-1}(E_A))} \lim_{\mu \rightarrow \infty} \int_E f(\xi) \left[ \frac{\varphi_A(\xi)}{\varphi_A(A)} \right] \, d\mu(\Phi_A(\xi)). \tag{5}
\]
Since

\[ \mu(\Phi_A(\xi)) = |\det J(\xi, A)| \, d\mu(\xi), \]

where \( J(A, \xi) \) is the Jacobi matrix of the transformation \( \Phi_A(Z) \), and (see [4])

\[
\det |J(\xi, A)| = \frac{\prod_{j=1}^{n} H(A^j, \xi^j)H(\xi^j, A^j)}{\prod_{j=1}^{n} H(A^j, \xi^j)},
\]

the application of formula (5) to the function \( f(\xi) \prod_{j=1}^{n} H^{-1}(\xi^j, A^j) \in H^1(T_n) \) gives (4).
